

ABB MEASUREMENT & ANALYTICS | DATA SHEET

VA Master FGM1190

Glass tube variable area flowmeters

Measurement made easy

Robust and reliable glass tube variable area flowmeter

Function

 Glass tube variable area flowmeter for the measurement of clear liquids and gases

Areas of application

 Suited for flow measurements in many industrial sectors such as apparatus engineering, the food and beverage industry, water treatment systems and the chemicals sector

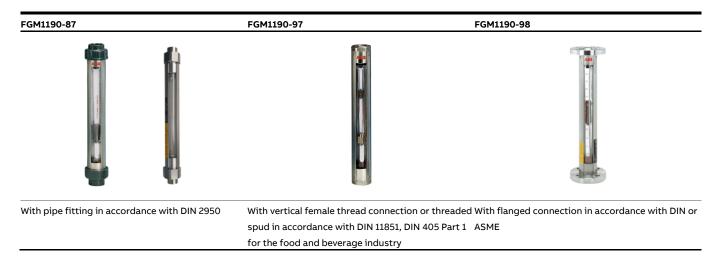

Product highlights

- Precision tubes with guide surfaces, guide ribs or guide rod
- · Standard stainless steel housing
- Easy disassembly of the meter tube due to the O-ring seal
- Meter tube and float can be replaced independently of each other

Important product features

 A magnetically actuated alarm signaling unit size ½ in and up can be attached to the flowmeter

Overview

In addition to the designs presented above, the FGM1190-95 model with a horizontal female thread connection is available.

Functional description

The VA Master FGM1190 series flowmeters work according to the float principle.

The position of the float in the conical glass meter tube is proportional to the flow. It can be read on the scale fitted to the meter tube.

Four different types of scale can be used:

- Directly readable scale in flow units
- · Percentage scale
- DK/DS scale
- Millimeter scale

When using the DK/DS scale a flow rate table is available for the flowmeter. For other operating conditions, the user can create additional tables.

Flowmeters in sizes ½ in to 2 in are provided with a percentage scale in the standard design. The device has a factory plate indicating the flow rate for the display of 100 %. The other scale values can be linearly converted. A special reading curve is therefore not required.

On request, conversion equations for flow calculation for other operating conditions will be made available.

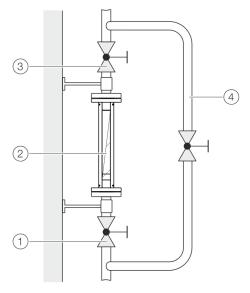

Introduction and basics

Installation conditions

General

The following points are to be considered during installation:

- Prior to installation in the piping, remove the wooden pole used as a transportation lock from the meter tube.
- The glass tube variable area flowmeter is installed vertically in the piping. The measuring media must flow from bottom to top.
- Keep the device as far away as possible from pipe vibrations and powerful magnetic fields.
- The nominal diameter of the piping should be the same as the connection nominal diameter.
- Inlet and outlet sections are not required.
- · Avoid pulsating flows and sudden pressure surges.
- · Use valves which open slowly.
- If the flowmeter is installed in a pipeline where decommissioning is impossible or inexpedient, a bypass line should be provided.
- For gaseous measuring media, the flowmeter should be installed as close as possible to the pipe constrictions. The nominal diameter of the piping at the outlet of the flowmeter should be measured as small as possible.
- Stop and throttle valves should preferably be attached to the outlet of the flowmeter.
- For liquid measuring media, the nominal diameter of the piping should be dimensioned as large as possible (if economically viable).

- 1 Stop valve in the inlet
- 3 Stop valve in the outlet
- 2 Flowmeter
- (4) Bypass line

Figure 1: Installation of the flowmeter

Installation recommendations

Refer to VDI / VDE Directive 3513 sheet 3, Selection and Installation Recommendations for Variable Area Flowmeters.

Pressure chambers and collecting tanks

If piston pumps or compressors are used for the transport of the measuring media, a pulsating flow of the measurement media must be expected.

In order to reduce the pulsating of the float, the installation of pressure chambers or collecting tanks in the piping before the flowmeter is recommended.

Operating conditions

A variable area flowmeter is specified for a defined set of operating conditions of the measuring medium. For liquids and gases, these are pressure and temperature-related properties (density and viscosity) under operating conditions.

For gases, in particular, this means operating at a specific operating pressure and operating temperature. The specified accuracy of the device always refers to the operating conditions underlying the specification.

Pressure loss

The available operating pressure at the measuring point must be higher than the pressure loss listed for the flowmeter in the specifications.

It is important to also consider the pressure loss downstream from the flowmeter due to losses in the piping and other fittings.

For the design of the device please check the ABB Product Selection Assistant, available at www.abb.com/flow.

Prevention of compression oscillations when measuring gases

During low flow amounts and low operating pressure, socalled compression oscillations of the float can occur. To prevent self-generated compression oscillations, note the following information from VDI / VDE 3513 Sheet 3:

- Select a flowmeter with the lowest possible pressure loss.
- Minimize the piping length between the flowmeter and the nearest upstream or downstream throttling location.
- Set the limit of the regular measuring range from the usual 10 to 100 % to 25 to 100 %.
- When setting the flow rate value, always start by assuming larger values.
- Increase the operating pressure and consider its effect on the flow rate changes due to the change in gas density in the operating conditions.
- Minimize non-throttled, free volumes upstream and downstream of the device.

Pressure shocks

Especially when measuring gases, it is possible that pressure or shock waves can occur when fast opening solenoid valves are employed and the piping cross-sections are not throttled, or if there are gas bubbles in liquids.

As a result of the sudden expansion of the gas in the piping, the float is forcibly driven against the upper floatstop. Under certain conditions, this can lead to destruction of the device.

Avoid pressure shocks when operating the devices.

Solids content in the measuring medium

Variable area flowmeters have only limited suitability for measuring media containing solids.

Depending on the concentration, particle size and type of solid, increased mechanical abrasion may occur, especially at the critical measuring edge of the float.

In addition, solidified deposits on the float can change its weight and shape.

These effects can lead to erroneous measurement results, depending on the float type.

In general, the use of appropriate filters is recommended in such applications.

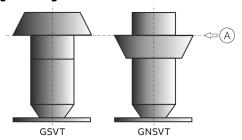

For the flow measurement of measuring media containing magnetic particles, we recommend the installation of a magnetic separator upstream of the variable area flowmeter.

... Introduction and basics

Float designs

With a range of around 100,000 possible variable area flowmeter designs, different meter tube float-scale combinations are used.

Float with guide ring

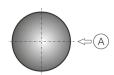

(A) Index markers

Figure 2: Float with guide ring

In combination with three-rib meter tubes and a percentage scale, floats with a guide ring represent the standard design. GSVT type floats are essentially independent of viscosity and available in different materials and weights in the individual device sizes. The reverse head shape of GNSVT type makes it possible to achieve a 25 to 30 % higher flow rate. This float shape is not suited for measuring media with higher viscosities. The VIN numbers in the float selection program must be observed.

The float is guided to the measuring edge and the guide ring in the guide ribs of the meter tube.

Ball float

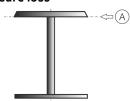

A Index markers

Figure 3: Ball float

Ball floats are used to measure small flow rates for meter tube sizes $\frac{1}{16}$ in to $\frac{1}{4}$ in. To achieve as many measuring range levels as possible within a meter tube, ball floats made from various materials of different densities are available.

Float with low pressure loss

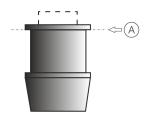

(A) Index markers

Figure 4: Float with low pressure loss

Floats with low pressure loss are specially developed for the measurement of gaseous measuring media at low pressures and ensure an extremely low device pressure loss. They are used in conjunction with three-rib meter tubes.

BL type float

(A) Index markers

Figure 5: BL type float

BL type floats are specially developed for measuring high flow rates with small meter tube sizes.

The float is guided in the guide ribs of the meter tube.

Scale designs

Percentage scale

The linearized percentage scale is the standard scale for three-rib meter tubes and smooth conical meter tubes. It shows the percentage based on the maximum flow rate and extends mostly over a total range of 8 to 100 %. When the operating data, the physical properties of the measuring medium, as well as the float design are known, the maximum flow rates are relatively easy to calculate and convert. Each percentage scale has the accuracy specified by ABB.

Directly readable scale in flow units

The scale directly displays the volume or mass flow rate per unit of time: (e. g. I/h hydrogen, cm³/min H_2O). The scale is only valid for one measuring medium under precisely defined conditions. Certain limits to the universal applicability of the meter tubes are set by the directly readable scale.

Meter tube designs

The meter tube is available with three designs.

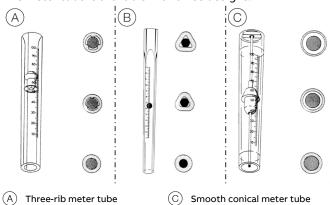

Figure 6: Meter tube versions

Three-surface meter tube

Three-rib meter tube

The three-rib meter tube is used as standard for meter tube sizes from $\frac{1}{2}$ in to 2 in. In this type of meter tube, the ribs parallel to the unit center lead the float over the entire measuring range.

The small distance between the float and the meter tube ensures identification of the index marker without any problems, even in murky measuring media. The three-rib meter tube is used together with floats with a guide ring.

Three-surface meter tube

The three-surface meter tube is used with smaller meter tube sizes from $\frac{1}{6}$ to $\frac{1}{4}$ in. Three surfaces run parallel to the center axis in the meter tube that is extended conically in the flow direction. This surface guides the ball-float over the entire measuring range.

The small distance between the float and the meter tube ensures identification of the index marker without any problems, even in murky measuring media. The float is guided precisely in the middle of the meter tube.

Smooth conical meter tube

The smooth conical meter tube is usually only used for extreme operating conditions (e.g. frequent load changes and switching operations).

With a nominal diameter of 1 $\frac{1}{2}$ in to 2 in, upper range values are produced due to the larger cross-section compared to the three rib meter tube. In a meter tube, the float is guided on a guide rod.

Specification

Scale design

Scale length	Measuring tube sizes
130 mm	⅓ in bis ¼ in
250 mm	½ in bis 2 in

Accuracy class

In accordance with VDI/VDE 3513, sheet 2

Accuracy class	Measuring tube sizes
1,6 % qg = 50 %	¹⁄₀ in to 2 in
6 % qg = 50 %	½ in to 2 in (with BL type float)

The specified accuracy class of the devices is only achieved by observing the valid operating conditions for the device (operating pressure and operating temperature).

... Specification

Temperature limits °C (°F)

Ambient temperature T_{amb.}

Permissible ambient temperature range:

- Liquid measuring media: -40 to 60 °C (-40 to 140 °F)
- Gas measuring media: -40 to 40 °C (-40 to 104 °F)

Measuring medium temperature T_{medium}

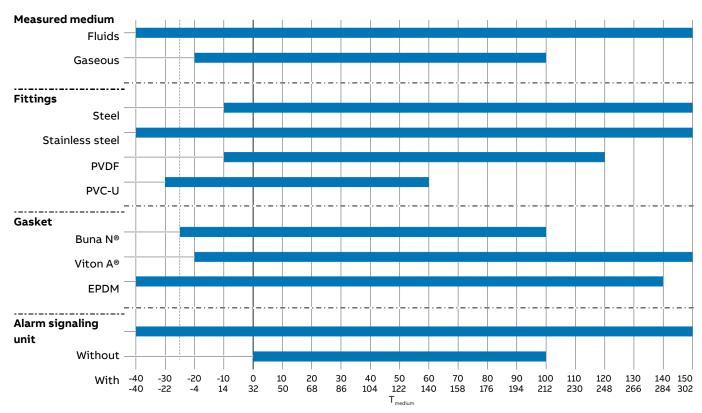

Figure 7: Measuring medium temperature permitted depending on the measuring medium and equipment

For more information about the maximum measuring medium temperature, see Material load on page 10.

Process connections

Refer to **Dimensions** on page 13.

Weight

Refer to **Dimensions** on page 13.

Operating pressure

Maximum permissible operating pressure						
Measuring tube sizes	Fluids	Gases				
¹/s in, ¹/₄ in	30 bar	30 bar				
	(3 MPa / 435.1 psi)	(3 MPa / 435.1 psi)				
½ in	21 bar	17 bar				
	(2.1 MPa / 304.6 psi)	(1.7 MPa / 246.5 psi)				
3/4 in	17 bar	13 bar				
	(1.7 MPa / 246.5 psi)	(1.3 MPa / 188.6 psi)				
1 in	14 bar	10 bar				
	(1.4 MPa / 203 psi)	(1 MPa / 145 psi)				
1 ½ in	9 bar	4 bar				
	(0.9 MPa / 130.5 psi)	(0.4 MPa / 58 psi)				
2 in	7 bar	2 bar				
	(0.7 MPa / 101.5 psi)	(0.2 MPa / 29 psi)				

With meter tube sizes of 1 in to 2 in, the maximum permissible operating pressure is reduced by 1 % for each 2 °C (3.6 °F) at operating temperatures of over 95 °C (203 °F) (for liquids).

The reduced pressure values for gas applications are a result of safety considerations.

The resistance of the polycarbonate thermowell is reduced along with increasing temperatures. For this reason, consider the following when measuring gas:

- The listed maximum permissible operating pressure applies for measuring medium temperatures up to 30 °C (86 °F) and ambient temperatures up to 30 °C (86 °F).
- For measuring medium or ambient temperatures over 30 °C (86 °F), the maximum permissible operating pressure is reduced by 1.05 % for each 1 °C (1.8 °F) (for gas).

Alarm signaling unit

1 Max. alarm signalling unit

(2) Min. alarm signalling unit

Figure 14: Alarm signaling unit 55AX1000

One or two 55AX1000 type alarm signaling units can optionally be attached to the flowmeter housing. The alarm signaling unit is designed as a potential-free contact, actuated by a magnet in the float. An external one or two-channel switching amplifier is required to operate the alarm signaling unit.

Note

- The alarm signaling unit is suited only in connection with type FGM1190 flowmeters with a meter tube size > 1/4 in
- The alarm signaling unit is suited only in connection with float types G(N)SVT, (N)SVP and BL.

The alarm signaling unit is used in a guide slot in the flowmeter housing and can be adjusted across the entire measuring range.

Specifications	
Operating mode	Inert gas switch
	(reed contact, bistable switching behavior)
Switching behavior	
• Lower limit value	Contact closes in the event of a falling float
• Upper limit value	Contact closes in the event of a rising float
Switching capacity	Maximum 10 VA, U _B = 30 V, 50 / 60 Hz
Permissible ambient	-20 to 60 °C (-4 to 140 °F)
temperature	
Connection type	Silicone cable SIHF-I 2 x 0.5 mm ² ,
	length 1.75 m (5.74 ft)
IP rating	IP 65 (in accordance with DIN EN 60529)

Ex-relevant specifications for operation in zones 2, 22

The glass tube variable area flowmeter can be used without further restrictions in the hazardous area of Zone 2 and Zone 22.

Flowmeter Ex marking

II 3G Ex h T6...T3 Gc II 3D Ex h T6...T3 Dc

Ta= -40...+60°C

Surface temperature

Notice: The maximum surface temperature of the device corresponds to the maximum measuring medium temperature (if this is higher than the ambient temperature). If there are uncertainties regarding the maximum measuring medium temperature, the corresponding security surcharges for the maximum surface temperature when using the device are included in the calculations.

D55AX alarm signaling unit Ex marking

II 3G ec IIC T6...T3 Gc

The rated voltage of the alarm signaling unit is U_M = 60 V AC, 75 V DC.

Electrical connection for the alarm signaling unit

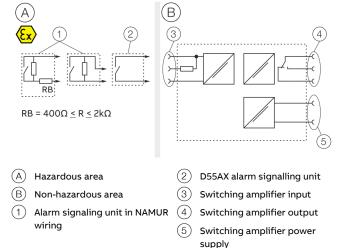

Figure 17: Connection of an alarm signalling unit to a switching amplifier (example)

The circuits (between the alarm signalling units and the switching amplifier) are intrinsically safe. The switching amplifier itself must be mounted outside the hazardous area.

Information for safe operation in potentially explosive atmospheres

When operating in hazardous areas, observe the following points and instructions.

Assembly / Commissioning

When installing the flowmeter, ensure that there are no external mechanical influences on the flowmeter.

Operation

- Make sure that the chemical resistance and temperature resistance of the gaskets are observed.
- Make sure that the permissible operating conditions and ambient conditions are observed.
- Make sure that the measuring medium does not contain any corrosive metal particles.
- Make sure that the liquid measuring media do not have any gas inclusions.
- · Avoid pulsating flow of the measuring media.
- Avoid compression oscillations, see Prevention of compression oscillations when measuring gases on page 5.

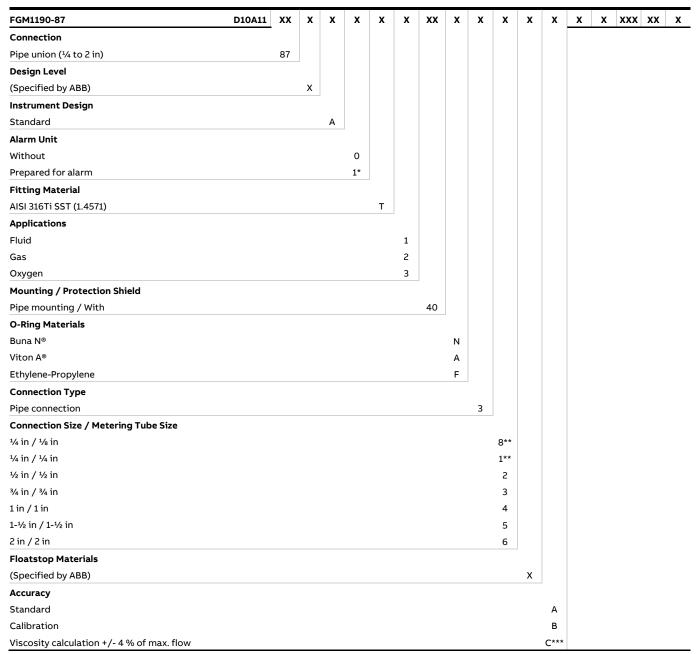

Maintenance / Repair

Ensure that only original parts are used during maintenance and repair work.

- Make sure that there are no solid particles or loose parts in the piping.
- When cleaning the plastic thermowell, use a moist cleaning cloth only to avoid the risk of explosion due to electrostatic charging.
